

 The Complete "From Scratch" Modding Guide Project: Mini Militia Classic 0.14.4 (Unlimited Ammo/Nitro) Part 1: Setting Up the Environment (The "Lab")

1. Install WSL and Kali Linux
- 2.

Open PowerShell as Administrator and run: `wsl --install -d kali-linux` 2. Restart your PC. 3. Open the Kali Linux app, create your username and password. 2. Install Development Tools Run these commands in your Kali terminal to install the necessary software: `Shell Script sudo apt update && sudo apt upgrade -y`

Install Java, Apktool, Signing tools, and Hex editor

`sudo apt install openjdk-17-jdk apktool apksigner zipalign unzip hexedit -y` 3. Install Ghidra 1. Download the Ghidra zip file from ghidra-sre.org inside Windows. 2. Extract it to a folder (e.g., C:\Ghidra). 3. To run it, double-click ghidraRun.bat. Part 2: Preparing the Project

1. Download the Original APK Download Mini Militia Classic 0.14.4. Ensure it is a "Universal" APK or "v7a + v8a" so it works on all your friends' phones.
2. Decode the APK Move the APK to your Kali home folder (/home/yourname/) and run: `Shell Script apktool d "Mini_Militia.apk" -o mm_mod` Part 3: Native Patching (The "Brains")
3. The 64-bit Mod (For Modern Phones)
- 4.

Open Ghidra and import `mm_mod/lib/arm64-v8a/libcocos2dcpp.so`. 2. LAN Ammo Fix: Go to address `0x00a482e0` (Weapon::subAmmo). ◦ Patch first instruction to: `RET` 3. Pro-Reload Fix: Search for `Weapon::completeReloadWeapon`. ◦ Find the `bl setAmmo` line at the bottom. ◦ Patch instruction to: `NOP` 4. Nitro Fix: Search for `SoldierLocalController::setPower`. ◦ Find the `STR` (Store) instruction. ◦ Patch instruction to: `NOP` 5. Export: File > Export Program > Format: Binary. Save it back to `mm_mod/lib/arm64-v8a/libcocos2dcpp.so`. 2. The 32-bit Mod (For Older Phones) 1. Import `mm_mod/lib/armeabi-v7a/libcocos2dcpp.so` into Ghidra. 2. Search Symbol Tree for the same function names (`subAmmo`, `completeReloadWeapon`). 3. Patch Logic: Use `BX LR` instead of `RET` for 32-bit returns. 4. Export: Save back to `mm_mod/lib/armeabi-v7a/libcocos2dcpp.so`. Part 4: Rebuilding and Security

1. Build the APK In your Kali terminal: `Shell Script`

Build using AAPT2 for modern compatibility

`apktool b --use-aapt2 mm_mod -o unsigned_mod.apk` 2. Create Your "Signature" (Do this once)  IMPORTANT: Backup this .jks file! If you lose it, you cannot update your mod later. `Shell Script keytool -genkey -v -keystore my-mod-key.jks -alias mm-alias -keyalg RSA -keysize 2048 -validity 10000` (Remember the password you choose!) 3. Sign the APK `Shell Script apksigner sign --ks my-mod-key.jks --out final-modded.apk unsigned_mod.apk` Part 5: Deployment 1. Start a Transfer

Server: `python3 -m http.server 8000` 2. Install on Phone: ◦ Uninstall original Mini Militia. ◦ Open phone browser, go to `http://[PC-IP]:8000`. ◦ Download and install final-modded.apk. ⚡ Summary of "Cheat" Offsets (Keep this!) • Ammo Subtraction (64-bit): `0x00a482e0` → RET • Ammunition Logic: `Weapon::subAmmo` • Power/Nitro Logic: `SoldierLocalController::setPower` • Reload Logic: `Weapon::completeReloadWeapon` Final Reminder: When playing in LAN, always have the person with the Modded APK be the Host of the room for the most stable experience.
